UGUNJA

INTRODUCTION TO COMPUTERS

SECTION A (THEORY)

1. What is a computer (2mks)

2. Give two reasons why computers are referred to as an electronic device (2mks)

3. List three major parts of a computer (2mks)

4. Giving examples in each, explain the following parts of computer: (4mks)

Software

Hardware

5. With an aid of a diagram, Describe the following; (9mks)

a. Mouse

b. Keyboard

c. Printer

6. Give what can be executed when the following key combinations are performed:

(10mks)

Ctrl+ A

Ctrl+ B

Ctrl+ C

Ctrl+ X

Ctrl+ N

Ctrl+ Z

Ctrl+ P

Ctrl + U

Ctrl + V

Alt + F4

7. State and explain classification of computers according to physical size

(5mks)

8. A mouse is a hand-driven device that can be used to control the pointer display on the screen. It is a pointing device. Give other examples of pointing devices.

(4mks)

Your name here:

9. A mouse can be used in four different ways. State different mouse technics. (4mks)

.....

.....

.....

.....

10. Give two differences between laptop computers and desktop computer (4mks)

11. Explain three reasons why Computer technology has been embraced by all sectors in life (education, health, Military, industries, etc.) (6mks)

12. The time and date of your laptop is incorrect. Describe how you would set it correctly (3mks)

13. Explain five importance of computers (10mks)

14. Explain five disadvantages of computers (10mks)

ICT ACADEMY

SECTION B (PRACTICAL)

15. Perform the following tasks

- i. You have been provided by a laptop with an internet access.
- ii. Download an open source software called Mozilla Firefox. (5mks)
- iii. Install and open a new tab on it. (10mks)
- iv. Insert the link below;
 - <https://img.utdstc.com/screen/5e6/9c6/5e69c6bfe0f3f6a65728979f848d1c6742746f93fd683327d0b6712b98ea0e8e:800>
- v. Download the picture and save in your folder. (2mks)
- vi. Set it as your desktop icon (3mks)
- vii. Below is an extract of what booting is. Launch a microsoft word program and type it. Save in your folder as '*My sample work*' (5mks)

What happens during cold boots (When a computer is powered on)?

viii.

A cold boot is the action of powering up a computer system from a state of zero power. It involves turning on the main power supply or pressing the power button on a device that has been completely shut down and disconnected from any electrical power sources. During this process, the system undergoes a full initialization sequence, which is critical for the proper functioning of hardware and software components.

When a cold boot is initiated, a series of systematic operations unfolds within the computer's architecture. Initially, the power supply sends an electrical charge to the motherboard, which triggers the Basic Input/Output System (BIOS) or Unified Extensible Firmware Interface (UEFI). This foundational software performs a Power-On Self-Test (POST) to ensure all hardware components are functioning correctly. Following successful diagnostics, the bootloader is engaged, locating and launching the operating system from the hard drive or solid-state drive into the computer's Random Access Memory (RAM). The culmination of these steps results in a ready-to-use system.
